- Turbine rotor disk with integral blade cooling air slots and pumping vanes.
- The A rotor disk (33) for a gas turbine engine includes a central load-bearing web portion (70) and a centrifugal pump (62) portion located externally of the load-bearing web portion for pumping cooling air into an array of turbine blades. The pump portion

includes an enlarged material section (75) formed homogeneously with the web portion (70) and extends axially forwardly and radially inwardly from the rim (61) of the disk.

material section is formed homogeneously with said web portion.

- The disk of claim 1, wherein said internal slot is disposed completely externally of said web portion.
- 11. A forward seal and rotor disk assembly, comprising:

a rotor disk comprising a hub portion, a web portion, a rim portion, and a material section extending axially forwardly from said web portion and having a plurality of slots formed there-through; and

a forward seal comprising a hub portion, at least one labyrinth seal, and an air shield arm projecting from said forward seal and sealingly engaging said material section of said rotor disk.

- The assembly of claim 11, wherein said air shield arm projects from said labyrinth seal.
- 13. The assembly of claim 12, further comprising an inner labyrinth seal for sealing compressor discharge leakage air, said inner labyrinth seal comprising a support arm for supporting said forward seal.
- 14. The assembly of claim 13, wherein said forward seal is cantilevered from said inner labyrinth seal.
- 15. The assembly of claim 11, wherein said rotor disk further comprises a flange for mounting said rotor disk to a rotor shaft and wherein said hub portion of said forward seal is disposed radially outwardly of said flange.
- 16. The assembly of claim 11, wherein said rotor disk further comprises a flange for mounting said rotor disk to a rotor shaft and wherein said plurality of slots is disposed radially outwardly of said flange.
- 17. A rotor disk for a turbine engine, said disk comprising a hub portion, a web portion extending radially outwardly from said hub portion, a rim portion located on a radially outer end portion of said web portion, and pumping means disposed externally of said web portion and formed homogeneously with said web portion for pumping cooling air radially outwardly adjacent said web portion and into said rim portion.
- 18. The rotor disk of claim 17, wherein said pumping means comprises a plurality of radially

extending slots located adjacent said web portion.

10

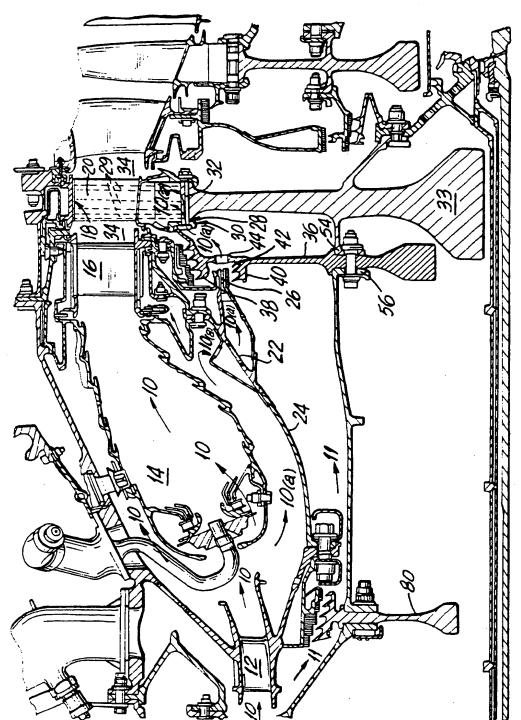

19. The rotor disk of claim 18, wherein said pumping means further comprises a plurality of circumferentially-spaced and radially extending vanes located between said plurality of slots.
